

Pre-made Target Over-expression Lentivirus

CAT#	Product	Accession ID
LVPxxx	Concentrated Expression Lentivirus (200ul at titer of 1x 10 ⁸ IFU/ml)	

Amount: 200u/vial (1 x 10⁸ IFU/ml)/each.

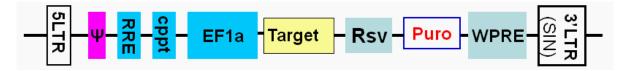

Storage: <-70 °C, avoid repeat freeze/thaw cycles. Stable for 6 months at <-70oC.

Product Description:

GenTarget's Lentivector system is Human Immunodeficiency Virus-1 (HIV) based lentivector plasmids for gene expression and knockdown. The lentivectors are used to generate lentiviral particles (lentivirus) that can be transduced into most mammalian cell types, including stem cells, primary cells, and non-dividing cells both *in vivo* and *in vitro*. Lentiviral Particles stably integrate into the transduced cells' genome for long term expression, making lentivirus a great gene transfer agent.

This target over-expression Lentivirus products, is generated from GenTarget's Lentivector. The target is expressed under the enhance EF1a promoter which is less cell type dependent and not be silenced *In vitro* and *In vivo*, also strong in many primary cells and T cells, B cells, and more. The lentivirus contains the **Puromycin** selection under RSV promoter.

The Lentivector is adapted the most advanced biosafety features, including the self-inactivation feature in its 3' LTR, and only generates the replication-incompetent lentivirus. See the lentivector's map scheme below.

The <u>Negative Control Lentivirus</u> can be used to establish the controls for lentivirus treatment in a given cell line. The control lentivirus, CAT# <u>EF1a-Null-Puro</u>, has the identical lentivector backbone with the puromycin resistance, as that of target expression, but does not express any target. Please see also "<u>FAQs about premade</u> <u>lentiviral particles</u>".

Key features:

- 1) High target expression levels driven by strong enhanced EF1a promoter, best for primary cells, suspension cells, T cells, B cells and more;
- 2) Puromycin killing selection;
- 3) Ready to use and easy to use: simply add it into your cell culture, No need any other reagents or procedures;

Transduction Protocols:

1) Transduction Protocol for Adhesive cells :

Note: lentivirus is provided as ready to use. Simply add it into your cell culture; the amount to add depends on cell type.

Quick transduction protocol: add 50 μ l of virus into each well of 24well-plate where cell density is 50% to 75%. After 72 hours (no need to change medium), check transduction rate by fluorescence signal. For stable cell line generation, pass cells into medium containing antibiotic or carry out the fluorescence cell sorting.

Day 0:

Seed cells in complete medium at the appropriate density and incubate overnight.

Note: at the time of transduction, cells should be 50%-75% confluent. For example, seed HeLa cells at 0.5×10^{5} /ml x 0.5ml in a well of a 24-well plate.

Day 1:

- Remove the culture medium and add 0.5ml fresh, warm, complete medium.
- Thaw the lentiviral stock at room temperature and add the appropriate amount of virus stock to obtain the desired MOI, normally use MOI from 2 to 10.
- Return cells to 37°C, CO₂ incubator.
 Note: If you do not use all of the virus at one time, you can re-freeze the virus at -80 °C for future use; virus titer will decrease by ~10% for each freeze/thaw cycle.

Day 3:

At ~72hr after transduction, check the transduction rate under fluorescence microscopy or calculate the exact transduction rate by

flow cytometry (FACS or Guava). Carry out the expression detection assay.

Day 3 +

Sort transduced cells by FACS, or select the transduced cell by antibiotic resistance. A pilot experiment should be done to determine the antibiotic's kill curve for your specific cell line (refer to the pertinent literature on generation of stable cell lines).

2) Transduction Protocol for Suspension Cells:

Grow cells in complete suspension culture medium; use a shaking flask in a CO^2 incubator if necessary.

Measure cell density. When density has reached $\sim 3 \times 10^6$ cells/ml, measured viability should be > 90%. Dilute cells into 1 x 10⁶ cell/ml in complete medium.

Day 1:

- Thaw lentiviral particles at room temperature.
- Add premade lentiviral particles into the diluted cells at a ratio of: 50 to 100 μ l virus per 0.5 ml of cells (Note: depending on cell type, you may need to use more or less virus).
- Grow cells in a shaking flask in a CO2 incubator.

Day 2:

At 24 hours after transduction, add an equal amount of fresh medium containing relevant antibiotics. **Note:** amount of antibiotic depends on cell type. Continue growing cells in CO2 incubator.

Day 3:

At 72 hours after transduction, check fluorescence with a fluorescence microscope or calculate the transduction efficiency using a cell sorter such as FACS or Guava. Sort for fluorescence positive cells and maintain antibiotic selection to generate a stable cell line.

Safety Precaution:

Gentarget lentiviral particles adapts must advanced lentiviral safety features (using the third generation vectors with self-inactivation SIN-3UTR), and the premade lentivirus is replication incompetent. However, please use extra caution when using lentiviral particles. Use the lentiviral particles in Biosafety II cabinet. Wear glove all the time when handling Lentiviral particles!

Please refer CDC and NIH's guidelines for more details regarding to safety issues.

Warranty:

This product is for research use only. It is warranted to meet its quality as described when used in accordance with its instructions. GenTarget disclaims any implied warranty of this product for particular application. In no event shall GenTarget be liable for any incidental or consequential damages in connection with the products. GenTarget's sole remedy for breach of this warranty should be, at GenTarget's option, to replace the products.

Product Category	Product Description (please click into each category's page)	
<u>Pathway</u> <u>Reporter</u>	Repoter Lentivirus for all kinds of pathway screening assays	
<u>Cell</u> Immortalization	Lentivirus for cell immortalization: Large T-antigen, hTERT, EBNA1/EBNA2, HpV16-E6/E7, Adenovial E1A, Kras_G12V, HOXA9, et al.	
<u>ImmunoOncology</u> <u>Research</u>	Lentivirus products for immuno therapy research: CAR and TCR; Assay Cell Lines for T-cell targeted killing assay and other cell-based assays; over-expression lentivirus products for the immune response targets; Cell surface antigens (CDs); immune checkpoint / Receptors; CRISPR gene Repair and knock-IN lentivirus; CRISPR knockout lentivirus;	
<u>CAR-T, TCR</u> <u>Lentivirus</u>	CARs Lentivirus: Anti-CD19 /CD20 /CD22 /BCMA /hHER2 /HLA-A2 /TGFβ; TCRs : MART-1/ NY-ESO1/ CD1d-α-GalCer/ TRαV3-F2A-TRβV5-6;	
<u>CRISPR Gene</u> <u>Editing</u>	Preamde lentivirus express humanzied wild-type Cas9 endonuclease, the dCas9 , gRNAs, CRISPR gene editing research	

Attachment: GenTarget's pre-made lentivirus product categories.

GenTarget Inc

Product	Product Description	
Category	(please click into each category's page)	
Epigenomic:	"dCas9-Protein" fusion Lentivirus for epigenomic	
CRISPRi and	modification, resulted in CRISPR interference (CRISPRi)	
<u>CRISPRa</u>	or activation (CRISPRa).	
	a set of reporter lentiviruses to express a luminescence	
Cell-Specific	or fluorescent reporter (firefly Luciferase, Renilla	
<u>Reporter</u>	luciferase, RFP or GFP fluorescent marker) under a	
Infectious	tissue specific promoter Llentivirus that express all kinds of infectious antigens	
Antigens	with C-term 6His-tag.	
Virus Like	Lentiviral Like Particles, pseudo-typed with a different	
Particles (VLP)	envelope proteins.	
Non-integrating	Integration Defective Lentivirus, express different	
LV	targets for transient expression without the unwanted	
	insertional mutagenesis.	
<u>shRNA</u>	Knockdown verifeid and customized shRNA lentivirus for	
<u>Knockdown</u>	target knockdown,	
microRNA	Premade lentivirus expression human or mouse	
lentivirus	precursor miRNA. And anti-miRNA lentivector and	
	virus for human and mouse miRNA.	
<u>Anti-miNA</u>	Pre-made lentivirus expression a specific anti-miRNA	
lentivirus	cassette.	
Human and	Premade lentivirus expressin a human, mouse or rat	
mouse ORFs	gene with RFP-Blastididin fusion dual markers.	
Luciferase	Premade lentivirus for all kinds of luciferase protein	
expression	expression: firefly and Renilla, Red-Luc and more,	
	with different antibiotic selection markers.	
Fluorescent	Lentivirus express all commonly used fluorescent	
<u>Markers</u>	proteins: GFP, RFP, CFP, BFP YFP, niRFP, unstable GFP	
	and others.	
Luminescent	Lentivirus express Nano-Latern as Bio-probes for in vivo	
Imaging	imaging of sub-cellular structural organization and	
Sub-collular	dynamic processes in living cells and organisms	
Sub-cellular Imaging	Lentivirus contain a well-defined organelle targeting signal fusioned to a fluorescent protein, great tools for	
Indging	live-cell imaging and for dynamic investigation of sub-	
	cellular signal pathways.

GenTarget Inc

Product	Product Description
Category	(please click into each category's page)
Cytoskeleton	A fluorescent marker (GFP, RFP or CFP) fusion with a
<u>Imaging</u>	cellular structure protein, provides a convenient tool for
	visualization of cytoskeletal structure
Unstable GFP	Lentivirus express the the destabilized GFP (uGFP) which
	provides fast turnover responses in signal pathway
	assay and in knockdown / knockout detection
near-infrared RFP	The near-infrared Red fluorescent (niRFP) expression
	Lentiviurs provides the whole-body images with better
	contrast and brighter images
Fluorescent-ORF	Pre-made lentivirus expression a "GFP/RFP/CFP-ORF"
fusion	fusion target.
	Premade lentivirus for expressing nuclear permeant
CRE recombinase	CRE recombinase with different flurescent and antibiotic
	markers.
CRE, Flp	Lentivirus expressing "LoxP-GFP-Stop-LoxP-RFP" or
<u>ColorSwtich</u>	"FRT-GFP-Stop-FRT-RFP" cassette, used to monitor the
	CRE or Flp recombination event in vivo.
CEAD Departer	lentivirus expressing SEAP under different promoters
SEAP Reporter	(TetCMV, EF1a, CAG, Ubc, mPGK, Actin-beta or a signal
	pathway responsive promoter), Premade lentivirus expressin TetR (tetracycline
TetR Repressor	regulator) protein, the repressor protein for the
	inducible expression system.
	rtTA binds to the tetracycline operator element (TetO) in
rtTA Expression	the presence of doxycycline (Dox). Used for Tet-On /OFF
	inducible system.
	Premde lentivirus for human and mouse iPS (Myc,
iPS factors	NANOG, OCT4, SOX2, FLF4) factors with different
	fluorescent and antibitoic markers
LacZ expression	Express different full length β- galactosidase
	(lacZ) with different selection markers
	Premade negative control lentivirus with different
Negative control	markers: serves as the negative control of lentivurs
<u>lentiviruses</u>	treatment, for validation of the specificity of any
	lentivirus target expression effects.
Other Enzyme	Ready-to-use lentivirus, expressing a specific enzymes
<u>expression</u>	with different selection markers.
<u>Ultra titer</u>	Ultra-titer lentivirus used for the hard-to-transduced
