

Color-Switch CRE Reporter Stable Cell Line

Catalog Number	Product Name / Description	Amount
<u>SC018-Bsd</u>	CRE reporter cell line (Bsd): HEK293-loxP-GFP- RFP (Bsd). Cell line expresses "LoxP-GFP-stop-LoxP-RFP" cassette with blasticidin antibiotic marker.	1 vial of cells (1.0 ml, 2 x 10 ⁶ cells) in cell frozen medium
<u>SC018-Neo</u>	CRE reporter cell line: HEK293-loxP-GFP- RFP (Neo). Cell line expresses "LoxP-GFP-stop-LoxP-RFP" cassette with Neomycin antibiotic marker.	1 vial of cells (1.0 ml, 2 x 10 ⁶ cells) in cell frozen medium
<u>SC018-Puro</u>	CRE reporter cell line: HEK293-loxP-GFP- RFP (Puro). Cell line expresses "LoxP-GFP-stop-LoxP-RFP" cassette with Puromycin antibiotic marker.	1 vial of cells (1.0 ml, 2 x 10 ⁶ cells) in cell frozen medium
<u>SC071-Neo</u>	CRE reporter cell line: HeLa-loxP-GFP- RFP (Neo). Cell line expresses "LoxP-GFP-stop-LoxP-RFP" cassette with Neomycin antibiotic marker.	1 vial of cells (1.0 ml, 2 x 10 ⁶ cells) in cell frozen medium
<u>SC071-Puro</u>	CRE reporter cell line: HeLa-loxP-GFP- RFP (Puro). Cell line expresses "LoxP-GFP-stop-LoxP-RFP" cassette with Puromycin antibiotic marker.	1 vial of cells (1.0 ml, 2 x 10 ⁶ cells) in cell frozen medium

Storage:

Upon received, place vial in Liquid Nitrogen for long-term storage, or saved in -80oC for short-time storage up to 1 week.

1. Product Description

CRE recombinase, from bacteriophage P1, catalyzes recombination between 34 base-pair target sequences called lox sites and can join individual plasmids containing lox sites. CRE recombination provides an excellent tool for conditional gene targeting in transgenic animal models by linking genotypic alterations to the biological outcomes (phenotypes).

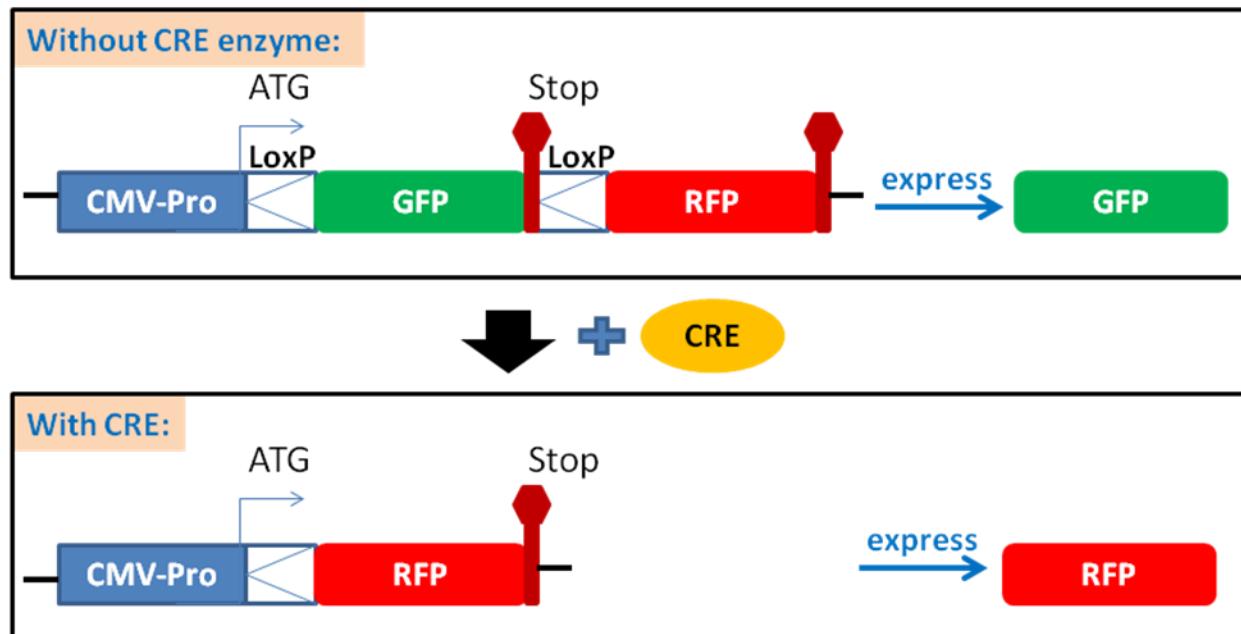

By inserting a "LoxP-flanked expression target" into a host's genome, target expression can be controlled via CRE recombinase. Expression of LoxP-flanked target genes may occur prior to the addition of CRE enzyme; when CRE is applied, it deletes the LoxP flanked target segment and stops the target expression. Simultaneously, CRE-mediated recombination can activate expression of a second target downstream from the deleted segment.

CRE-LoxP recombination depends upon an effective CRE enzyme delivery *in vivo*. GenTarget provides [pre-made CRE expression lentiviral particles](#) which are engineered with a NLS (nuclear localization signal) element, providing high efficiency delivery of the expressed CRE protein into cell nuclear where the recombination occurs.

In order to monitor and to confirm the CRE-LoxP recombination event, GenTarget also generates the **CRE reporting cell lines**. Those stable cell lines are derived from either HEK293 cell line or Human Hela cell line. [Note: GenTarget provides the **CRE reporting lentivirus** (CAT#: [LVP460](#)), for make your own CRE reporting cell line in your desired host cell types] .

The HEK293 Cell Line is a permanent line established from primary embryonic human kidney transformed with sheared human adenovirus type 5 DNA. The expressed E1A adenovirus gene allows these cells to produce very high levels of protein. The CRE reporting cell line's genome has integrated with a CRE recombination response, "**Color-Switch segment**" (see DNA insertion scheme below). Each cell line has also integrated with an antibiotic selection marker under a RSV promoter (not showed in the scheme below), thus each cell line has a specific antibiotic marker, blasticidin (Bsd), Puromycin (puro) or Neomycin (Neo) for selection purpose when applicable.

HeLa cell line is an immortal cell line derived from cervical cancer cells taken from a female patient, Henrietta Lacks, in year 1951. The cell line was found to be remarkably durable and prolific. It is the oldest and most commonly used human cell line in all kinds of biomedical research, such as studying the effects of diseases or developing medications and vaccines, and play an invaluable role in medicine.

2. How it works:

The CRE reporting cell lines are used to monitor or confirm the efficiency of CRE recombination *in vivo*. It is a great method and easy tool to verify the performance of your CRE enzyme (your CRE expression plasmids, or pre-made CRE expression lentivirus, or purified CRE enzyme) in vivo conditions. It is also a control test to verify your CRE-loxP based system.

The cell line demonstrates strong **GFP** (Green Fluorescent signal). The downstream **RFP** (Red Fluorescent Protein) was not expressed because of the stop codon after the GFP. Once the CRE protein is present in nuclear, the CRE excises / deletes the DNA fragment between two loxP sites, which removes the stop codon (see the DNA structure scheme above). As a result, the RFP is then expressed, and the cell line switches to RFP fluorescent. The GFP and RFP signal can be easily monitored via fluorescent cell sorting (for the ratio between GFP and RFP cells), or visualized under Fluorescent microscope, or measured the fluorescent intensity if desired.

Notes:

*Like any mammalian pol II promoter, the CMV promoter seek any possible ORFs, and in some cell types, it can slightly express the 2nd ORF (the RFP in this case) which is considered the basal or leaking RFP signal.

** If CRE does not deliver into all cells, you may see some GFP positive cells after the CRE addition.

***Also, because some cells may integrate multiple copies of the LoxP-GFP-LoxP-RFP cassette, you may observe both GFP and RFP signals in a few cells after the addition of CRE recombinase. The important observation is the dramatic increase in RFP positive cells following addition of CRE. And the RFP/GFP intensity ratio reflects the CRE recombination rate.

3. Application protocol:

1) Culture the cell in completed medium (see **Culture procedures** below):

The CRE reporting cell lines express GFP without any treatment. Seed cells into 24-well plate at appropriate cell density (like 1 ~ 2 × 10⁵ cells/per well), incubate 37°C, 5% CO₂ for overnight;

2) CRE enzyme delivery:

One the 2nd day when the cell density at 50% ~ 75% confluent, add CRE enzyme as follows:

- a. Simply add 50ul of pre-made CRE expression lentiviral particles (see GenTarget's [pre-made CRE expression lentivirial particles](#) product page).
- b. Transfect your CRE expression plasmid using a transfection lipids (like LF2k or Fugene).
- c. Add purified nuclear membrane penetrating CRE protein directly into cell culture.

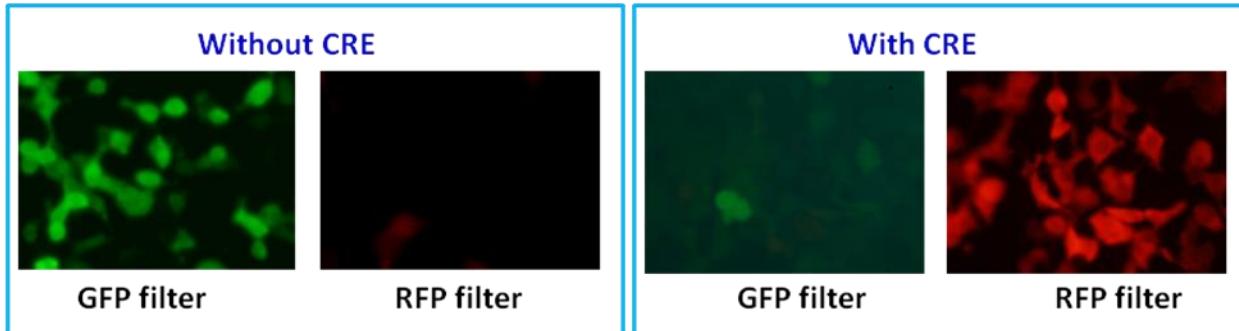

(**Note:** remember to set the negative control wells without adding CRE, and you may also set the positive control wells by adding 50ul of Gentarget's NLS-CRE expression lentiviral particles, Cat#: [LVP297](#), [LVP336](#), [LVP339](#) and others).

3) CRE recombination reaction detection:

The RFP signal will gradually show up and peaked at 48 hours or longer times (dependent upon CRE delivery methods) after the CRE delivery. The RFP/GFP cell population ratio or the RFP signal intensity reflects the CRE-LoxP recombination efficiency (rate). You can sort the cell by FACS machine, fluorescent meters, or visualize the RFP positive cell under fluorescent microscope.

4. Sample images of CRE-loxP recombination detection:

Left panel / without CRE: CRE reporter cell line (Cat#: **SC018-Bsd**) was cultured in completed. Images were taken under microscope with GFP filter set (Ex 490nm/Em 525nm) and RFP filter set (Ex 545nm/Em 620nm).

Right panel / with CRE: CRE reporter cell line (Cat#: **SC018-Bsd**) was cultured in completed in 24-well plate. 50ul of CRE expression lentiviral particle (Cat#: **LVP339**) was added into the cells in one well. Images were taken at ~ 72 hours after the addition of CRE expression lentivirus.

5. Culture procedures

- 1) Thaw the frozen vial of cells quickly in a 37°C water bath (1~3min), decontaminate the outside of the vial with 70% ethanol.
- 2) Transfer the entire contents of the cryovial into a T-75 cm² flask containing 20 ml of pre-warmed complete medium. Incubate the cells overnight in a 37°C incubator, 5% CO₂.
- 3) On the following day, replace the medium with 20 ml of prewarmed, complete medium.
- 4) Incubate the cells and monitor cell density.
- 5) Pass cells (1:5 to 1:10 dilution) using 0.25% Trypsin-EDTA solution when the culture reaches ~90% confluent.
- 6) Freeze cells at a density of ~3 x 10⁶ cells/ml using 90% complete medium with 10% DMSO.

6. Complete medium

DMEM (high glucose) for HEK293 Cells, or MEM for Hela Cells,
2mM L-glutamine
10% Fetal Bovine Serum (FBS)
0.1 mM MEM Non-Essential Amino Acids (NEAA)
1% Pen-strep / Antibiotic-antimycoplasma

- Optional to add: Depend upon product, add final **0.5 ug/ml** of Puromycin or **10 ug/ml** of Blasticidin, or 50 ug/ml **G418** (Note: do not add antibiotic at 1st time thaw culture).

7. Quality Control

Each vial contains $\sim 2 \times 10^6$ cells with >95% viability before freezing. Cells are verified to be free of bacteria, viruses, and mycoplasma.

8. Warranty and user terms

- 1) This product is warranted to perform as described when used in accordance with this manual. GenTarget's sole remedy for breach of warranty should be, at the option of GenTarget, to repair or replace the product if this product does not meet the stated quality standard.
